5

WHAT IS CLAIMED IS:

1. A method of converting a non-object oriented computer environment to a new object oriented computer environment, the method comprising the steps of:

identifying an existing object oriented computer environment;

identifying the non-object oriented computer environment;

defining requirements for the new object oriented computer environment;

selecting grammar and syntax compatible with the non-object oriented

computer environment;

developing object oriented extensions, wherein an existing application of the non-object oriented computer environment remains executable and wherein the new object oriented computer environment accesses information of the nonobject oriented computer environment; and

object oriented computer environment, wherein the new object oriented computer environment includes the requirements, the grammar and syntax and object oriented extensions.

- 2. The method of claim 1, wherein the step of identifying an existing object oriented computer environment includes identifying a commercially available object oriented computer environment.
- 3. The method of claim 1, wherein the step of identifying the non-object oriented computer environment includes identifying a legacy non-object oriented computer environment.
- 4. The method of claim 3, wherein the legacy non-object oriented computer environment includes a user language interface and data structures.

- 5. The method of claim 3, wherein the legacy non-object oriented computer environment allows multiple users.
- 6. The method of claim 3, wherein the legacy non-object oriented computer environment includes a distributed environment.
- 7. The method of claim 1, wherein the non-object oriented computer environment allows simulation modeling.
- 8. The method of claim 6, wherein the non-object oriented computer environment allows simulation modeling for the analysis of the performance of software executing in an computer system.
- 9. The method of claim 1, wherein the step of selecting grammar and syntax includes selecting the semantics of the non-object oriented computer environment.
- 10. The method of claim 1, wherein the step of selecting grammar and syntax includes selecting semantics compatible to the non-object oriented computer environment.
- 11. The method of claim 1, wherein the step of selecting grammar and syntax includes selecting the semantics of the existing object oriented computer environment.
- 12. The method of claim 1, wherein the step of developing object oriented extensions includes developing an object header structure and an object data structure.
- 13. The method of claim 11, wherein the step of developing an object header structure includes developing an object header structure that provides a unified object oriented interface to a user and internal objects.

- 14. The method of claim 11, wherein the step of developing an object data structure includes developing an object data structure containing a data structure of the non-object oriented computer environment.
- 15. The method of claim 1 further comprising the step of developing general-purpose utility classes.
- 16. The method of claim 1, wherein the step of preparing the new object oriented computer environment includes creating new code.
- 17. The method of claim 1, wherein the step of preparing the new object oriented computer environment includes creating an operating system.
- 18. The method of claim 1, wherein the new object oriented computer environment includes an object oriented computer language.
- 19. A computer system for simulation modeling, the computer system comprising: an object oriented programming language; application software written in the object oriented programming language,

wherein the application software simulates computer systems;

in which the object oriented programming language further comprises: an application logic function;

data types and scope, wherein the data types and scope include data types and scope of a non-object oriented programming language;

a class for message instancing.

20. The computer system of claim 19 wherein the object oriented programming language further comprises:

client workload models;

server process infrastructure;

database models;
operating system models;
statistics capability;
utility classes; and

garbage collection.

21. The computer system of claim 20 wherein the object oriented programming language is Object Oriented ADN.
